MySQL exercise 2

General instructions:

In this exercise you will create your own table within a given DB called myDB. You will then add entries into the table and modify them.

Write the appropriate query one need to run in order to receive the desired table and content.

Note that you should submit a single query per question!

1. Create the table "food". It should include (at least) three different columns: "ID" (this column should be the primary key), "Name" and "Do_I_like_it".
    Assign the appropriate data type to each column.
    Feel free to add more columns as you see fit.

2. Insert the following items: Pizza, broccoli and ice-cream, into the "food" table. Fill in the "Do I like it" column to fit your preference.

3. Update one of the entries by changing the answer in the "Do_I_like_it" column.

4. Delete the row you changed.
